

Harbor Loop Interim Evaluation

Fictional City of Northbridge | Reporting period: April-September 2032 | Published October 20, 2032

Executive summary

The Harbor Loop pilot began on April 3, 2032. Automatic passenger counter records show average weekday boardings increased from 6,800 in March to 8,240 in September. This descriptive comparison does not establish that the pilot caused the entire increase.

Service delivered

The pilot added six battery-electric buses and service every twelve minutes between 6 a.m. and 10 p.m. Scheduled trips operated at 91 percent on-time performance during the reporting period.

Measure	March baseline	September
Average weekday boardings	6,800	8,240
Median wait time	18 minutes	11 minutes

Interpretation and limitations

Competing explanations

Road construction near Central Station overlapped with the pilot. The evaluation cannot determine how many riders changed routes because of construction rather than the new service. A causal effect therefore remains unresolved.

Data reconciliation

The project dashboard counts transfer validations in its preliminary total. A separate community analysis reports 7,510 September weekday boardings after excluding possible duplicate transfers. The city has not yet published the row-level reconciliation needed to resolve the difference.

Next decision

The Mobility Lab recommends reconciling transfer rules, repeating the rider survey with a probability sample, and measuring winter reliability before a permanent funding decision.

This report is entirely synthetic and contains no real people, agencies, ridership records, or credentials.
